

Practical – PHP

Definition: Create a module for event management using PHP and MySQL as database.

Description:

There are 3 pages for this module:

1. Event add/Edit page
 - a. Event title – Text box
 - b. Event start date – Date Picker
 - c. Event end date – Date Picker
 - d. Recurrence
2. Event list page – Listing of events with “View”, “Edit” and “Delete” buttons.
 - a. Implement **lazy loading** of events after 10 events.
3. View Event page – When clicking on “View” button of an event from listing page, this page will open.

Total time: 4.5 hours

Development notes:

- If you want and comfortable, you can use Ajax instead of creating separate pages
- Not require to focus more on designing but usage of Bootstrap will be considered as extra advantage
- Ensure JavaScript and Server-side validations
- Coding standard must be followed
